

UX Redesign Case Study

Digikala Shopping Experience

Improving decision-making and reducing cognitive load in an e-commerce platform

This project focuses on analyzing and redesigning key user flows in Digikala to improve product discovery, filtering, and purchase decision experience.

UX Audit Summary

- Information overload in product listing
- Weak filtering guidance
- Poor decision support in product pages
- Inconsistent hierarchy in UI components
- Lack of structured review insights

The current experience increases decision time due to high information density.

Key Problem Definition

The core issue in Digikala is not feature limitation, but information architecture complexity. Users are overwhelmed by dense content, inconsistent hierarchy, and lack of structured decision support during the shopping journey.

- High cognitive load during browsing
- Weak prioritization in visual hierarchy
- Lack of structured comparison system
- Non-guided filtering experience

Selected Redesign Scope

This redesign focuses on three core screens that directly impact the purchase decision journey:

- Product Listing Page
- Product Detail Page
- Filter & Search Refinement System

Redesign: Product Listing Page

Problem:

- Overloaded product cards
- Weak visual hierarchy
- Difficult comparison between items

Solution:

- Simplified product card structure
- Clear hierarchy: Image → Price → Rating → Key feature
- Reduced secondary information visibility
- Improved scanability using grid alignment

Principle:

Hick's Law + Visual Hierarchy

Before:

After:

Redesign: Product Detail Page

Problem:

- Long scrolling without structure
- CTA not always visible
- Reviews not actionable

Solution:

- Structured sections with hierarchy
- Sticky CTA (Buy/Add to cart)
- Summary-first reviews section
- Grouped product information

Principle:

Fitts's Law + Progressive Disclosure

Before:

After:

Redesign: Filter & Search System

Problem:

- Flat filter structure
- No guidance for users
- High decision fatigue

Solution:

- Guided filtering experience
- Step-by-step refinement
- Smart suggested filters based on intent
- Progressive disclosure of advanced filters

Principle:

Cognitive Load Reduction + Decision Support Design

Before:

After:

Design System Approach

Components

- Product Card
- Button
- Filter Chip
- Rating Component

Action (On / Off)

☐ ☒

Icon Button

Button #1 (Just text)

Button #2 (With Icon)

Product Card

- Turn on or off rating
- Turn on or off chips
- Turn on or off Discount
- Turn on or off Additional Text

Principles

- Reusable components
- Consistent spacing
- Scalable patterns

Final Outcome

Through this redesign, the goal was to transform Digikala's shopping experience from a feature-rich but information-heavy interface into a more structured, intuitive, and decision-focused experience.

The redesign does not focus on adding more features, but on improving how existing information is organized and presented to users.

By restructuring the product discovery, filtering, and product evaluation flows, the new experience helps users move through the shopping journey with less effort and more confidence.

Improved Product Discovery

The redesigned product listing experience creates a clearer visual hierarchy, allowing users to quickly scan products, identify important information, and compare options more efficiently.

Reduced Cognitive Load

By removing unnecessary visual noise and prioritizing decision-critical information, users can focus on the factors that matter most during their shopping journey.

Better Decision Support

The redesigned product detail experience helps users evaluate products through a clearer structure, summarized insights, and easier access to important information such as specifications, reviews, and purchase actions.

More Guided Filtering Experience

The new filtering approach changes the experience from a simple list of options into a guided decision-making flow, helping users refine their choices based on their actual needs.

More Scalable Design System

The redesign introduces reusable components and consistent UI patterns to create a more maintainable and scalable design foundation.

Final Reflection

This project highlights the importance of designing not only for usability, but also for user confidence.

A successful e-commerce experience is not only about showing more products — it is about helping users understand their options, reduce uncertainty, and make better decisions.

The final solution creates a smoother shopping journey where users can discover, evaluate, and purchase products with less friction and greater clarity.
